### *How forecasts are made*

Most of the annual streamflow in the western United States originates as snowfall that has accumulated in the mountains during the winter and early spring. As the snowpack accumulates, hydrologists estimate the runoff that will occur when it melts. Measurements of snow water equivalent at selected manual snow courses and automated SNOTEL sites, along with precipitation, antecedent streamflow, and indices of the El Niño / Southern Oscillation are used in computerized statistical and simulation models to prepare runoff forecasts. These forecasts are coordinated between hydrologists in the Natural Resources Conservation Service and the National Weather Service. Unless otherwise specified, all forecasts are for flows that would occur naturally without any upstream influences.

Forecasts of any kind, of course, are not perfect. Streamflow forecast uncertainty arises from three primary sources: (1) uncertain knowledge of future weather conditions, (2) uncertainty in the forecasting procedure, and (3) errors in the data. The forecast, therefore, must be interpreted not as a single value but rather as a range of values with specific probabilities of occurrence. The middle of the range is expressed by the 50% exceedance probability forecast, for which there is a 50% chance that the actual flow will be above, and a 50% chance that the actual flow will be below, this value. To describe the expected range around this 50% value, four other forecasts are provided, two smaller values (90% and 70% exceedance probability) and two larger values (30%, and 10% exceedance probability). For example, there is a 90% chance that the actual flow will be more than the 90% exceedance probability forecast. The others can be interpreted similarly.

The wider the spread among these values, the more uncertain the forecast. As the season progresses, forecasts become more accurate, primarily because a greater portion of the future weather conditions become known; this is reflected by a narrowing of the range around the 50% exceedance probability forecast. Users should take this uncertainty into consideration when making operational decisions by selecting forecasts corresponding to the level of risk they are willing to assume about the amount of water to be expected. If users anticipate receiving a lesser supply of water, or if they wish to increase their chances of having an adequate supply of water for their operations, they may want to base their decisions on the 90% or 70% exceedance probability forecasts, or something in between. On the other hand, if users are concerned about receiving too much water (for example, threat of flooding), they may want to base their decisions on the 30% or 10% exceedance probability forecasts, or something in between. Regardless of the forecast value users choose for operations, they should be prepared to deal with either more or less water. (Users should remember that even if the 90% exceedance probability forecast is used, there is still a 10% chance of receiving less than this amount.) By using the exceedance probability information, users can easily determine the chances of receiving more or less water.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all of its programs and activities on the basis of race, color, national origin, gender, religion, age, disability, political beliefs, sexual orientation, and marital or family status. (Not all prohibited bases apply to all programs.) Persons with disabilities who require an alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at 202-720-2600 (voice and TDD).

To file a complaint of discrimination, write USDA, Director, Office of Civil Rights, Room 326W, Whitten Building, 14<sup>th</sup> and Independence Avenue SW, Washington DC 20250-9410 or call (202) 720-5964 (voice or TDD). USDA is an Equal Opportunity provider and employer.

# Washington Water Supply Outlook

## January 2003

### General Outlook

The State of Washington experienced one of the driest and warmest summer/fall periods on record. A good wet winter helped carry precipitation totals through the end of September at near normal levels, however July - September below average precipitation reduced what was much average conditions to only average. October and November were also very warm and dry. With December came the rains but also above average temperatures, delaying normal snowpack accumulation for at least a month. Considerable precipitation over the next several months will be required to mitigate current soil moisture, ground water and streamflow deficits.

### Snowpack

The January 1 statewide SNOTEL readings were much below average at only 59%. The Tolt River Basin snow surveys reported the lowest readings at 39% of average. Readings in the Quilcene River Basin reported the highest at 127% of average. Westside averages from SNOTEL, and January 1 snow surveys, included the North Puget Sound river basins with 63% of average, the Central Puget river basins with 45%, and the Lewis-Cowlitz basins with 68% of average. Snowpack along the east slopes of the Cascade Mountains included the Yakima area with 64% and the Wenatchee area with 76%. Snowpack in the Spokane River Basin was at 55% and the Walla Walla River Basin had 57% of average. Maximum snow cover in Washington was at Lyman Lake SNOTEL in the Chelan River Basin, with water content of 21.4 inches. This site would normally have 29.7 inches of water content on January 1. Last year at this time Lyman Lake had 32.9 inches of snow water. The highest average in the state was Mount Crag SNOTEL on the Olympic Peninsula with 127% of average.

| BASIN                   | PERCENT OF LAST YEAR | PERCENT OF AVERAGE |
|-------------------------|----------------------|--------------------|

## Precipitation

During the month of December, the National Weather Service and Natural Resources Conservation Service climate stations reported varying precipitation totals throughout Washington river basins. The highest percent of average in the state was at Republic, Washington. Republic reported 264% of average for a total of 4.77 inches. The average for this site is 1.81 inches for December. The wettest spot in the state was reported at June Lake SNOTEL with a December accumulation of 27.4 inches, slightly below average for the site. Basin averages for the water year are all below average with the Olympics reporting the highest at 86% and the Upper Yakima with the lowest at 46% of average.

| RIVER<br>BASIN              | DECEMBER<br>PERCENT OF AVERAGE | WATER YEAR<br>PERCENT OF AVERAGE |
|-----------------------------|--------------------------------|----------------------------------|
| Spokane .....               | 89 .....                       | 63                               |
| Colville-Pend Oreille ..... | 137 .....                      | 85                               |

| North Puget Sound .....     | 86 .....                       | 60                               |
| Olympic Peninsula .....     | 126 .....                      | 86                               |

## Reservoir

Seasonal reservoir levels in Washington vary greatly due to specific watershed management practices required in preparation for irrigation season, fisheries management, power generation and flood control. Reservoir storage in the Yakima Basin was 285,900-acre feet, 72% of average for the Upper Reaches and 78,900-acre feet, 71% of average for Rimrock and Bumping Lakes. Storage at the Okanogan reservoirs was 38% of average for January 1. The power generation reservoirs included the following: Coeur d'Alene Lake, 79,500 acre feet, 72% of average and 33% of capacity; Chelan Lake, 351,100 acre feet, 88% of average and 52% of capacity; and the Skagit River reservoirs at 102% of average and 83% of capacity.

| BASIN                       | PERCENT OF CAPACITY | CURRENT STORAGE AS<br>PERCENT OF AVERAGE |
|-----------------------------|---------------------|--|
| Spokane .....               | 33 .....            | 72                                       |
| Colville-Pend Oreille ..... | 90 .....            | 104                                      |
| Okanogan-Methow .....       | 26 .....            | 38                                       |
| Wenatchee-Chelan .....      | 52 .....            | 88                                       |
| Upper Yakima .....          | 34 .....            | 72                                       |
| Lower Yakima .....          | 34 .....            | 71                                       |
| North Puget Sound .....     | 83 .....            | 102                                      |

## Streamflow

January forecasts vary from 100% of average for the Dungeness River near Sequim to 54% of average for Mill Creek at Walla Walla. April-September forecasts for some Western Washington streams include the Cedar River near Cedar Falls, 85%; Green River, 78%; and Skagit River, 89%. Some Eastern Washington streams include the Yakima River near Parker, 70%; Wenatchee River at Plain, 70%; and Spokane River near Post Falls, 68%. Volumetric forecasts are developed using current, historic and average snowpack, precipitation and streamflow data collected and coordinated by organizations cooperating with NRCS. Caution should be used when using early season forecasts for critical water resource management decisions.

Statewide December streamflows were below average, due mostly to extremely dry conditions most of the month. Some localized flooding was reported during the stormy period around the holidays, however average flows remained well below normal. The Priest River near the town of Priest River had the highest reported flows with 84% of average. The Yakima River at Cle Elum with 28% of average, was the lowest in the state. Other streamflows were the following percentage of average: the Cowlitz, 36%; the Spokane at Spokane, 44%; the Columbia below Rock Island Dam, 63%; and the Cle Elum near Roslyn, 30%.

| BASIN                                      | PERCENT OF AVERAGE<br>MOST PROBABLE FORECAST<br>(50 PERCENT CHANCE OF EXCEEDENCE) |
|--|---|
| Spokane .....                              | 68  |
| Colville-Pend Oreille .....                | 66-91   |
| Okanogan-Methow .....                      | 66-78   |

# Columbia River Snowpack Summary

## January 1, 2003

## Spokane River Basin

\*Based on selected stations

The January 1 forecasts for summer runoff within the Spokane River Basin are 68% of average near Post Falls and 68% at Long Lake. The forecast is based on a basin snowpack that is 55% of average and precipitation that is 63% of average for the water year. Precipitation for December was below normal at 89% of average. Streamflow on the Spokane River at Long Lake, was 44% of average for December. January 1 storage in Coeur d'Alene Lake, was 79,500-acre feet, 72% of average and 33% of capacity. Snowpack at Quartz Peak SNOTEL site was 76% of average with 7.8 inches of water content. Average temperatures in the Spokane basin were 8 degrees above normal for December and 2 degrees above for the water year.

\* 90%, 70%, 30%, and 10% chances of exceeding are the probabilities that the actual volume will exceed the volumes in the table.

The average is computed for the 1971-2000 base period.

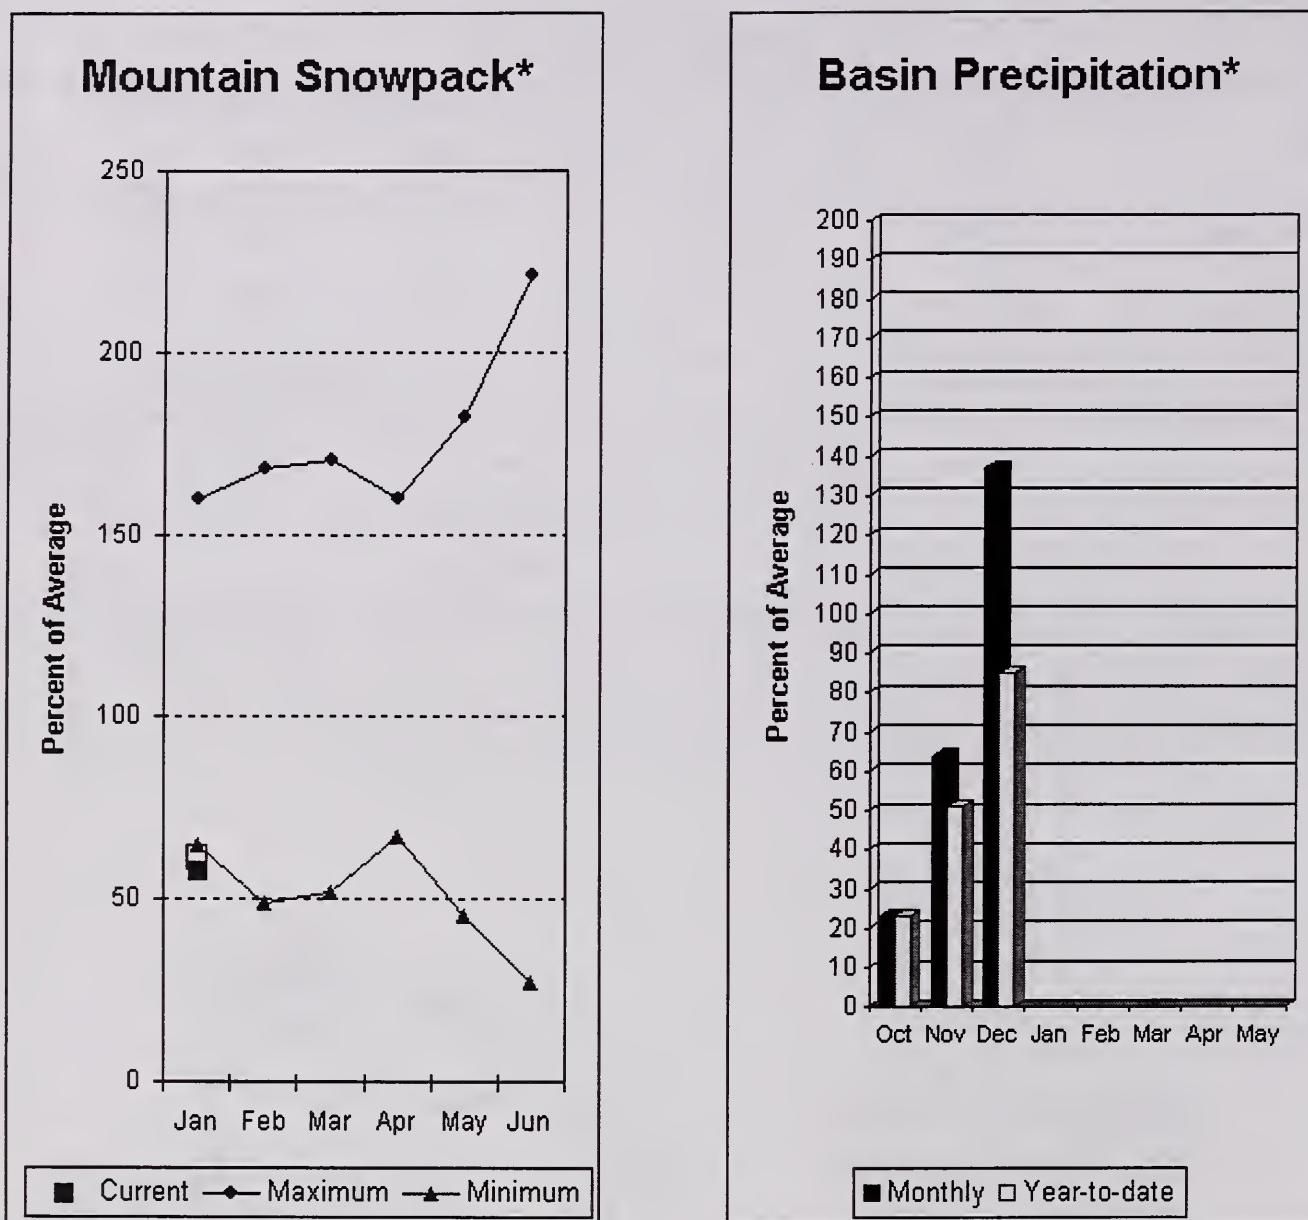

- (1) - The values listed under the 10% and 90% Chance of Exceeding are actually 5% and 95% exceedance levels.  
(2) - The value is natural volume - actual volume may be affected by upstream water management.

## Spokane River Basin Percent of Average January 1, 2003

Snowpack - 55%  
Precipitation - 63%  
Reservoir Capacity - 72%

## Colville - Pend Oreille River Basins

\*Based on selected stations

The April – September average forecast for the Kettle River streamflow is 91%, Colville at Kettle Falls is 84%, and Priest River near the town of Priest River is 80%. December streamflow was 64% of average on the Pend Oreille River, 71% on the Columbia at the International Boundary and 52% on the Kettle River. January 1 snow cover was 58% of average in the Pend Oreille Basin River Basin. Bunchgrass Meadows SNOTEL site had 13.7 inches of snow water on the snow pillow. Normally Bunchgrass would have 12.6 inches on January 1. Precipitation during December was 137% of average, bringing the year-to-date precipitation to 85% of average. Reservoir storage in Roosevelt and Banks lakes was reported to be 104% of average and 90% of capacity on January 1. Average temperatures were 8-10 degrees above normal for December and 3 degrees above for the water year.

\* 90%, 70%, 30%, and 10% chances of exceeding are the probabilities that the actual volume will exceed the volumes in the table.

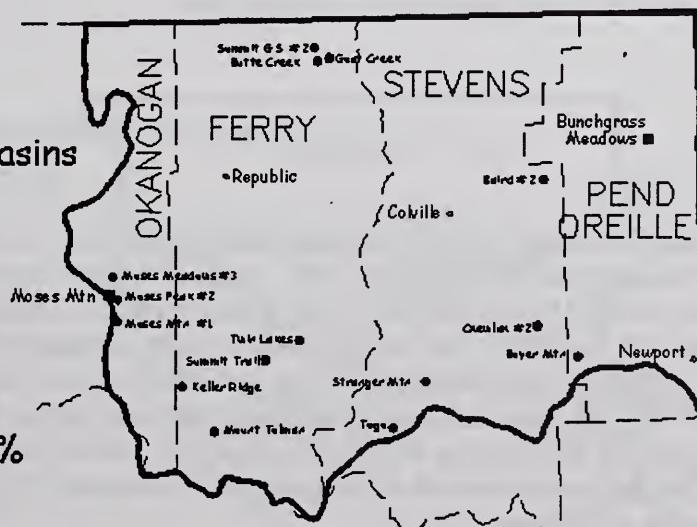

The average is computed for the 1971-2000 base period.

(1) - The values listed under the 10% and 90% Chance of Exceeding are actually 5% and 95% exceedance levels.

(2) - The value is natural volume - actual volume may be affected by upstream water management.

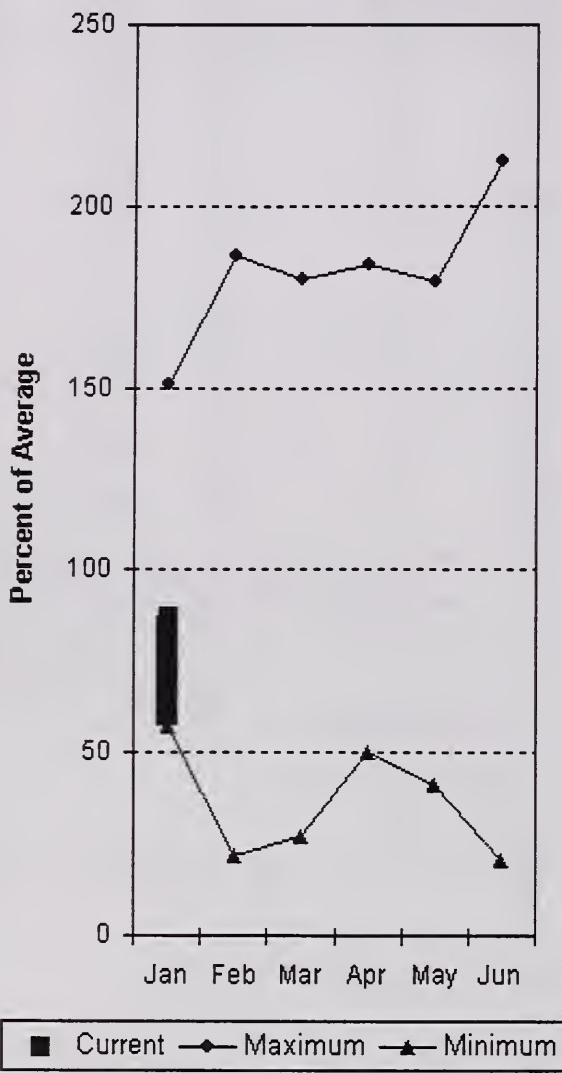

### Colville-Pend Oreille River Basins Percent of Average January 1, 2003

Snowpack - 58%  
Precipitation - 85%  
Reservoir Capacity - 104%

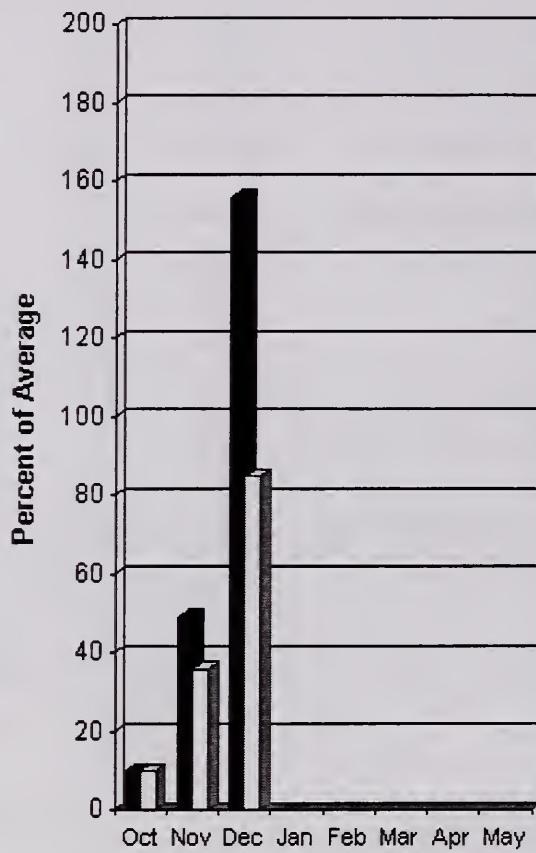

# Okanogan - Methow River Basins

**Mountain Snowpack\***

**Basin Precipitation\***

\*Based on selected stations

Summer runoff average forecast for the Okanogan River is 74%, Similkameen River is 76%, Methow River is 75% and Salmon Creek is 78%. January 1 snow cover on the Okanogan was 70% of average and Methow was 61%. December precipitation in the Okanogan-Methow was 156% of average, with precipitation for the water year at 85% of average. December streamflow for the Methow River was 64% of average, 60% for the Okanogan River and 48% for the Similkameen. Snow-water content at Salmon Meadows SNOTEL was 6.3 inches. Average for this site is 5.3 inches on January 1. Combined storage in the Conconully Reservoirs was 6,100-acre feet, which is 26% of capacity and 38% of the January 1 average. Temperatures were 8-10 degrees above normal for the past month and 2-3 degrees above normal for the water year.

- (2) - The value is natural volume - actual volume may be affected by upstream water management.

Okanogan-Methow River Basins  
Percent of Average  
January 1, 2003

Snowpack - 87%  
Precipitation - 85%  
Reservoir Capacity - 38%

## Wenatchee - Chelan River Basins

\*Based on selected stations

Precipitation during December was 97% of average in the basin and 62% for the year-to-date. Runoff for Entiat River is forecast to be 68% of average for the summer. The January-September average forecast for Chelan River is 76%, Wenatchee River at Plain is 70% and Stehekin is 74%. Icicle, Stemilt and Squilchuck creeks are all expected to fall into the same forecast range. December average streamflows on the Chelan River were 60% and on the Wenatchee River 35%. January 1 snowpack in the Wenatchee River Basin was 60% of average; the Chelan, 58%; the Entiat, 66%; Stemilt Creek, 85% and Colockum Creek, 109%. Reservoir storage in Lake Chelan was 351,100-acre feet, 88% of January 1 average and 52% of capacity. Lyman Lake SNOTEL had the most snow water with 21.4 inches of water. This site would normally have 29.7 inches on January 1. Temperatures were 8 degrees above normal for December and 1 degree above normal for the water year.

\* 90%, 70%, 30%, and 10% chances of exceeding are the probabilities that the actual volume will exceed the volumes in the table.

The average is computed for the 1971-2000 base period.

(1) - The values listed under the 10% and 90% Chance of Exceeding are actually 5% and 95% exceedance levels.

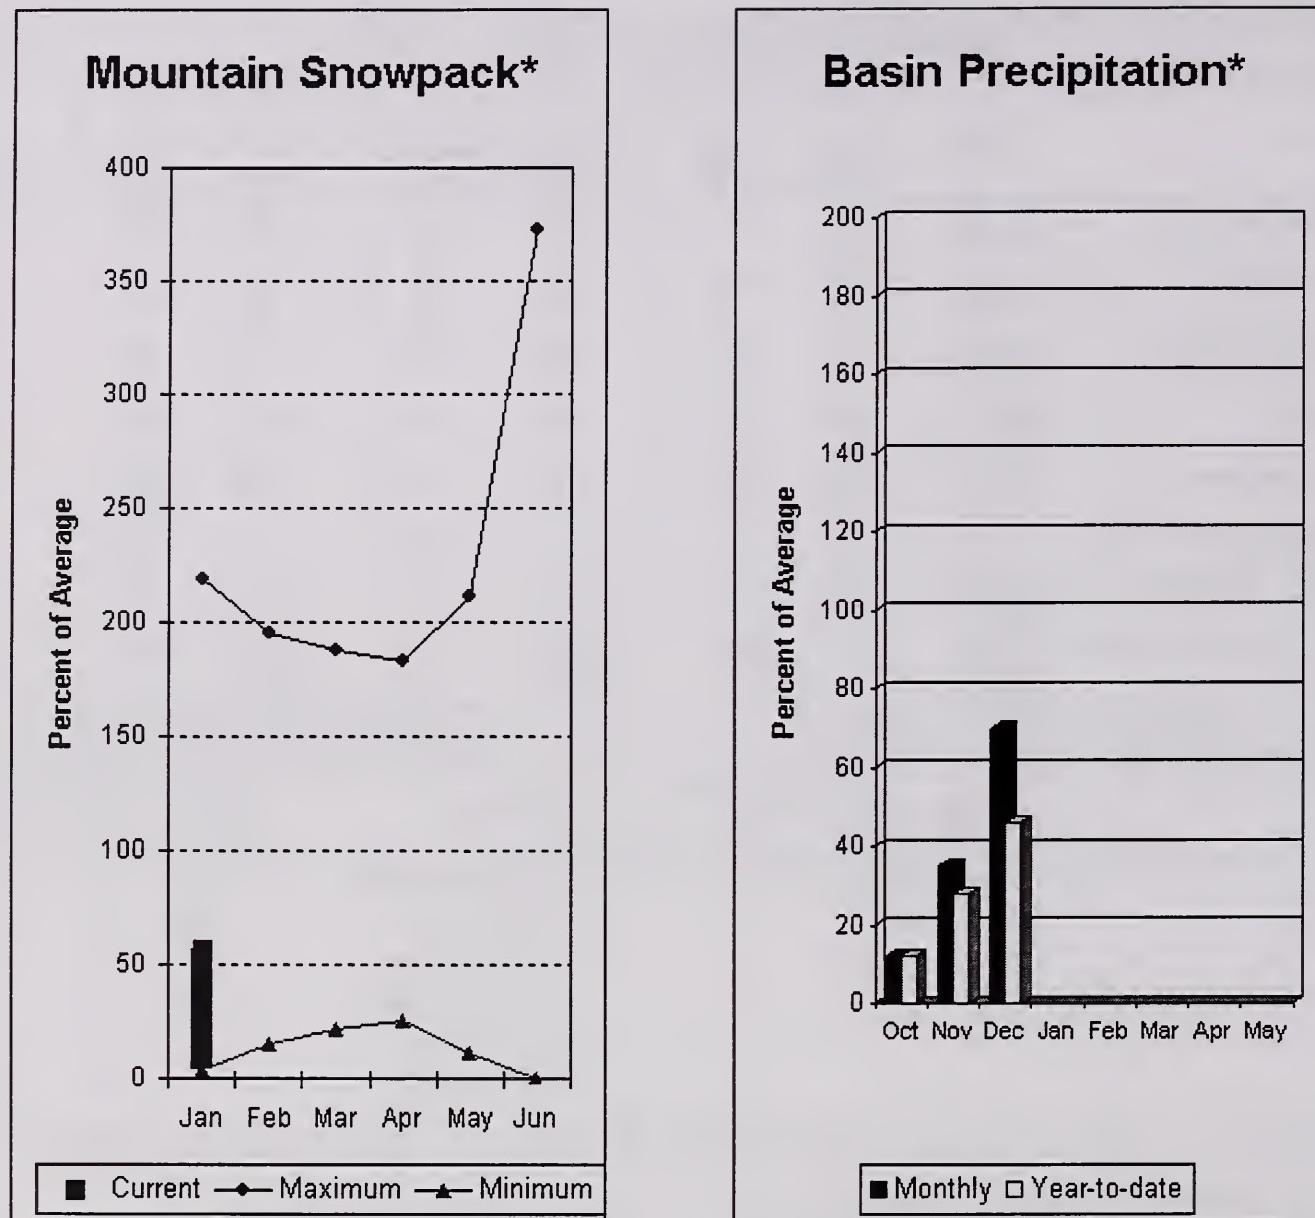

(2) - The value is natural volume - actual volume may be affected by upstream water management.

### Wenatchee-Chelan River Basins Percent of Average January 1, 2003

**Snowpack - 76%**  
**Precipitation - 62%**  
**Reservoir Capacity - 88%**

# Upper Yakima River Basin

\*Based on selected stations

January 1 reservoir storage for the Upper Yakima reservoirs was 285,900-acre feet, 72% of average. Forecasts for the Yakima River at Cle Elum are 72% of average and the Teanaway River near Cle Elum is at 71%. Lake inflows are all forecasted to fall into the same range this summer. December streamflows within the basin were Yakima near Cle Elum at 28% and Cle Elum River near Roslyn at 30%. January 1 snowpack was 57% based upon 9 snow courses and SNOTEL readings within the Upper Yakima Basin. Precipitation was 70% of average for December and 46% year-to-date for water. Volume forecasts for the Yakima Basin are for natural flow. As such, they January differ from the U.S. Bureau of Reclamation's forecast for the total water supply available, which includes irrigation return flow.

### Upper Yakima River Basin Percent of Average January 1, 2003

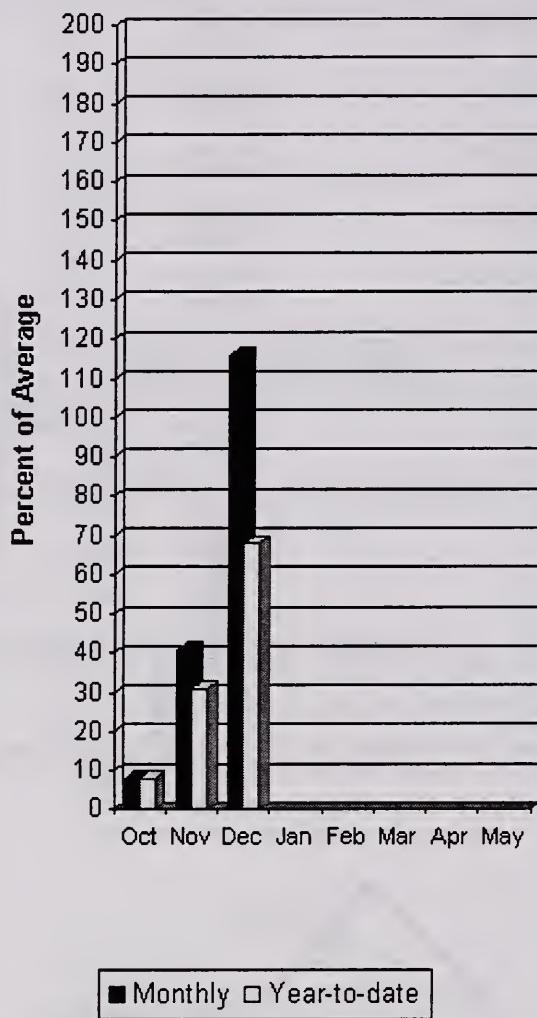

Snowpack - 57%  
Precipitation - 46%  
Reservoir Capacity - 72%

## Lower Yakima River Basin

**Mountain Snowpack\***

**Basin Precipitation\***

\*Based on selected stations

December average streamflows within the basin were: Yakima River near Parker, 37%; Naches River near Naches, 35%; and Yakima River at Kiona, 48%. January 1 reservoir storage for Bumping and Rimrock reservoirs was 78,900-acre feet, 71% of average. Forecast averages for Yakima River near Parker are 70%; American River near Nile, 73%; Ahtanum Creek, 70%; and Klickitat River near Glenwood, 88%. January 1 snowpack was 72% based upon 8 snow courses and SNOTEL readings within the Lower Yakima Basin. Precipitation was 116% of average for December and 68% year-to-date for water. Temperatures were 8 degrees above normal for the month and 1 degree above average for the water year. Volume forecasts for Yakima Basin are for natural flow. As such, they January differ from the U.S. Bureau of Reclamation's forecast for the total water supply available, which includes irrigation return flow.

\* 90%, 70%, 30%, and 10% chances of exceeding are the probabilities that the actual volume will exceed the volumes in the table.

The average is computed for the 1971-2000 base period.

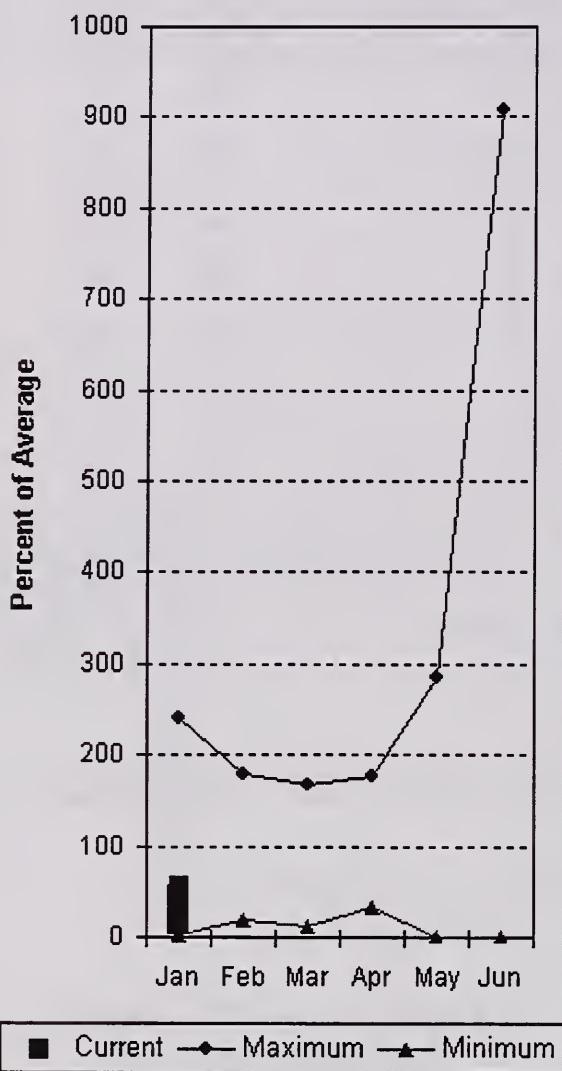

(1) - The values listed under the 10% and 90% Chance of Exceeding are actually 5% and 95% exceedance levels.

(2) - The value is natural volume - actual volume may be affected by upstream water management.

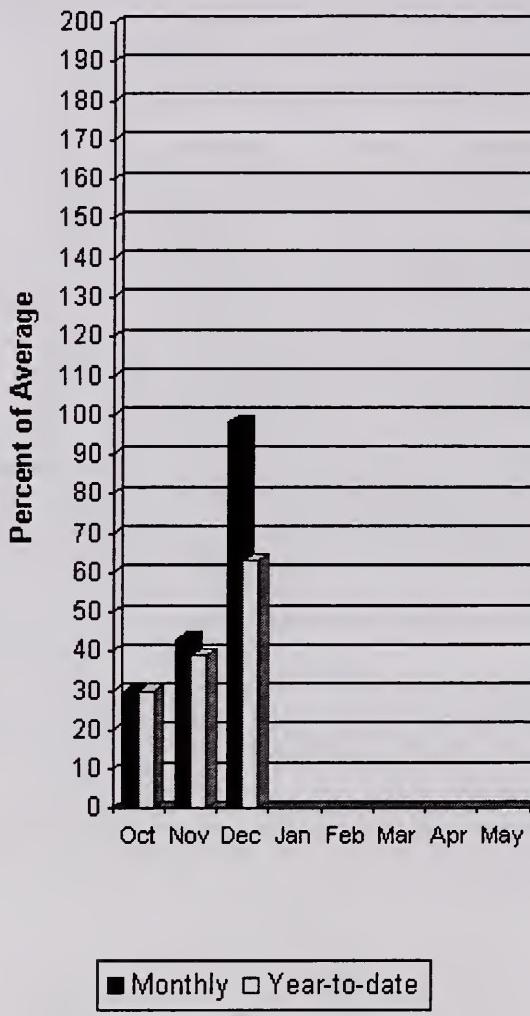

## Walla Walla River Basin

### Mountain Snowpack\*

### Basin Precipitation\*

\*Based on selected stations

December precipitation was 92% of average, maintaining the year-to-date precipitation at 59% of average. Snowpack in the basin was 57% of average. Streamflow forecasts are 54% of average for Mill Creek and 68% for the SF Walla Walla near Milton-Freewater. December streamflow was 30% of average for the Walla Walla River. Average temperatures were 9 degrees above normal for December and 1 degree above average for the water year.

## Cowlitz - Lewis River Basins

\*Based on selected stations

Forecasts for April – September streamflows within the basin are Lewis River at Ariel, 89% and Cowlitz River at Castle Rock, 82% of average. The Columbia at The Dalles is forecasted to have 75% flows this summer. December average streamflow for Cowlitz River was 36% and 61% for Lewis River. The Columbia River at the Dalles was also low at 58% of average. December precipitation was 103% of average and the water-year average was 68%. January 1 snow cover for Cowlitz River was 56%, and Lewis River was 79% of average. Average temperatures were 5 degrees above normal during December and have averaged 2-3 degrees above throughout the water year. A new SNOTEL site called Swift Creek was installed in the Lewis River Basin last summer. This site will provide information for managing Swift Reservoir.

\* 90%, 70%, 30%, and 10% chances of exceeding are the probabilities that the actual volume will exceed the volumes in the table.

The average is computed for the 1971-2000 base period.

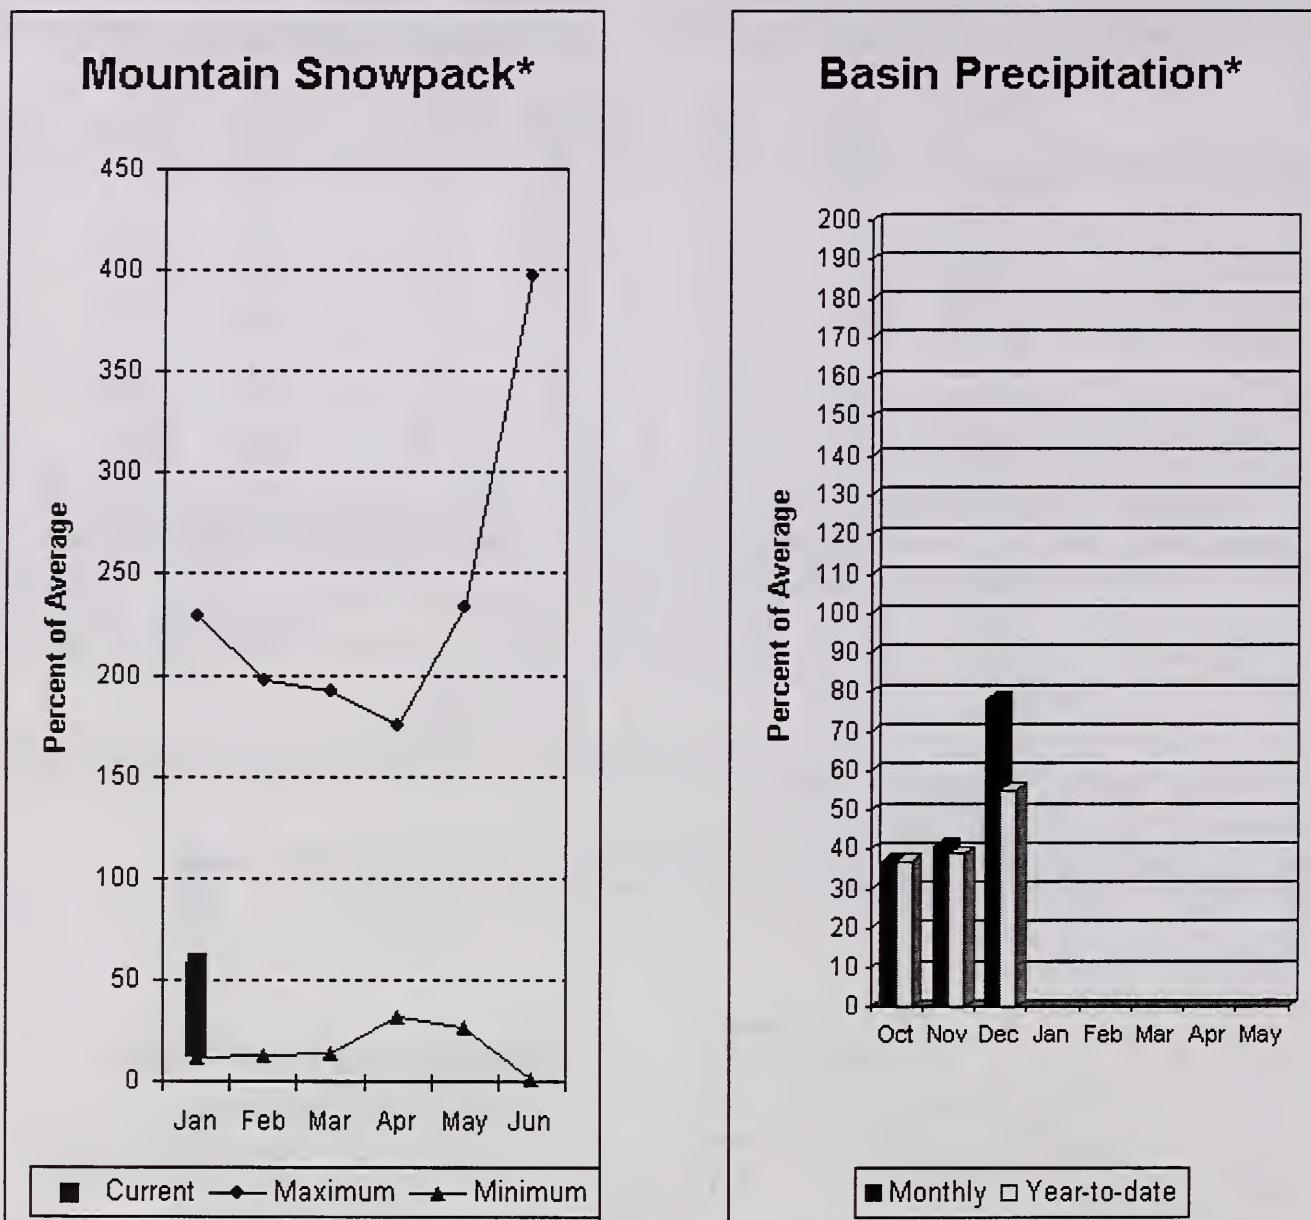

- (1) - The values listed under the 10% and 90% Chance of Exceeding are actually 5% and 95% exceedance levels.  
(2) - The value is natural volume - actual volume may be affected by upstream water management.

Snowpack - 68%  
Precipitation - 68%

## White - Green River Basins

\*Based on selected stations

Summer runoff is forecast to be 78% of normal for the Green River below Howard Hanson Dam and 82% for the White River near Buckley. January 1 snowpack was 63% of average in both White River and Puyallup River basins and 54% in Green River Basin. Water content on January 1 at Corral Pass SNOTEL, at an elevation of 6,000 feet, was 11.8 inches. This site has a January 1 average of 15.8 inches. December precipitation was 78% of average, bringing the water year-to-date to 55% of average for the basins. Average temperatures in the area were 5 degrees above normal last month and 2 degrees above for the water-year.

\* 90%, 70%, 30%, and 10% chances of exceeding are the probabilities that the actual volume will exceed the volumes in the table.

The average is computed for the 1971-2000 base period.

(1) - The values listed under the 10% and 90% Chance of Exceeding are actually 5% and 95% exceedance levels.

(2) - The value is natural volume - actual volume may be affected by upstream water management.

Olympic Peninsula River Basins  
Percent of Average  
January 1, 2003

Snowpack - 127%  
Precipitation - 86%

## The Following Organizations Cooperate with the Natural Resources Conservation Service in Snow Survey Work\*:

### **Canada**

Ministry of Sustainable Resources  
Snow Survey, River Forecast Centre, Victoria, British Columbia

### **State**

Washington State Department of Ecology  
Washington State Department of Natural Resources

### **Federal**

Department of the Army  
Corps of Engineers  
U.S. Department of Agriculture  
Forest Service  
U.S. Department of Commerce  
NOAA, National Weather Service  
U.S. Department of Interior  
Bonneville Power Administration  
Bureau of Reclamation  
Geological Survey  
National Park Service  
Bureau of Indian Affairs

### **Local**

City of Tacoma  
City of Seattle  
Chelan County P.U.D.  
Pacific Power and Light Company  
Puget Sound Power and Light Company  
Washington Water Power Company  
Snohomish County P.U.D.  
Colville Confederated Tribes  
Spokane County  
Yakama Indian Nation  
Whatcom County  
Pierce County

### **Private**

Okanogan Irrigation District  
Wenatchee Heights Irrigation District  
Newman Lake Homeowners Association  
Whitestone Reclamation District
